CSC 402 | Lab 3 Report

1. Implementation and Screenshots

1.1 Student Profile Card

A reusable profile card displays student information, including name, program, GPA, email, and city. Using a composable function keeps the presentation consistent and allows the same layout to be reused for multiple students.

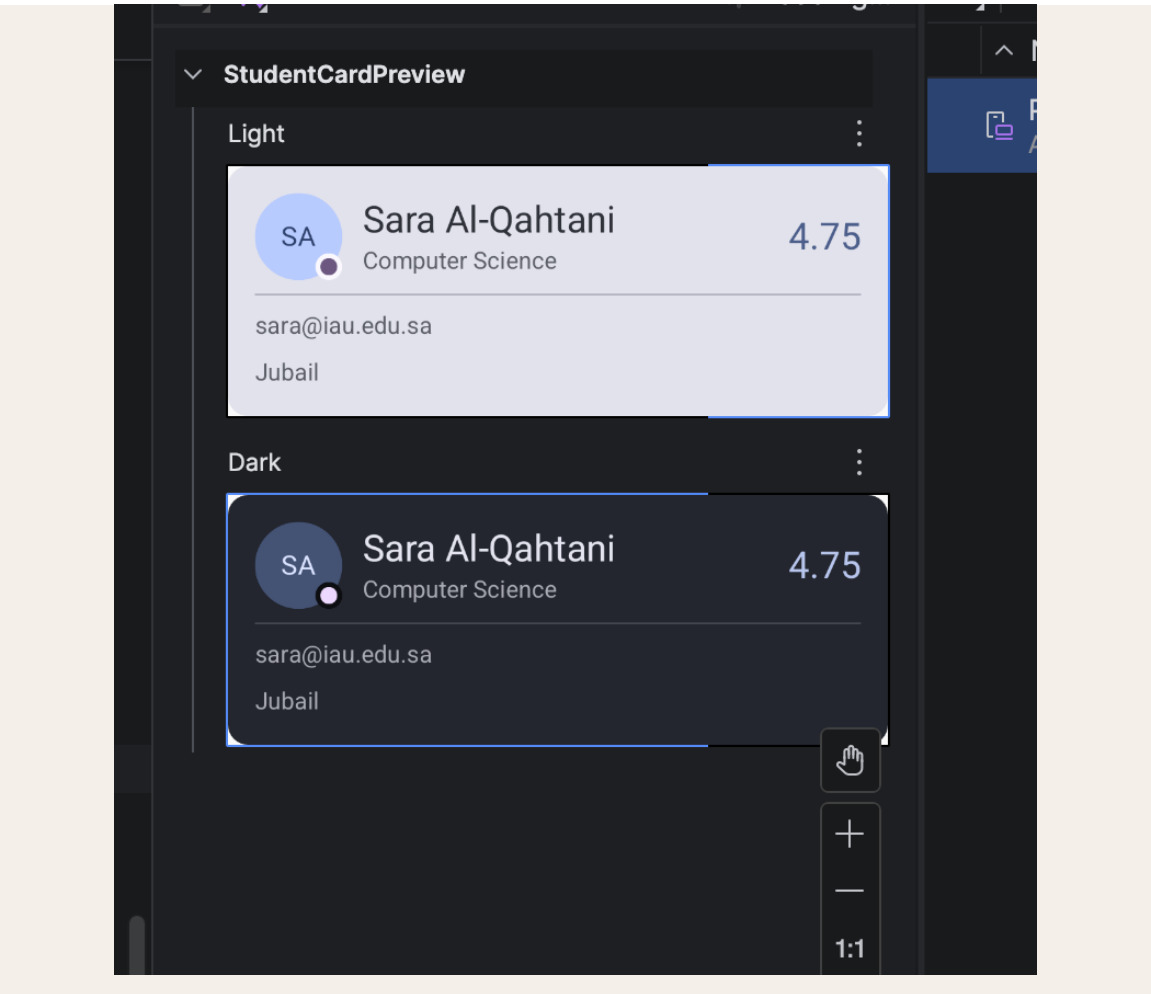

Figure 1— Student Card / ProfileCard Preview

1.2 Student List and Profile Screen

The profile screen presents multiple student cards in a scrollable layout. It includes a “My Profile” heading and an Edit action. LazyColumn supports displaying a list while keeping the code organized and reusable.

1.3 Light and Dark Appearance

The Compose preview can be used to examine how the profile components appear under light and dark display settings. Screenshots below document the actual results.

3.4 Modifier Order Exercise

The Modifier-order exercise compares composables with different sequences of layout and styling modifiers. The resulting size, spacing, and colored areas can change depending on the order in which modifiers are applied.

4. Team UI Theme: White, Beige, and Blue

Our team selected a white, beige, and blue color palette to create a clean, calm, and professional user interface. White provides a simple background that makes content easy to read and helps reduce visual clutter. Beige introduces warmth and a softer visual experience, making the interface feel welcoming rather than overly technical. Blue is used to emphasize important interface elements, such as headings, buttons, and interactive controls, and helps users identify key actions quickly. Together, these colors support visual consistency, readability, and a clear hierarchy across the application.

The theme is intended to use sufficient text-to-background contrast and consistent button and typography styles so that the interface remains understandable and accessible.

5. Reflection

This lab provided practice in organizing a Jetpack Compose project, creating reusable UI elements, arranging information in a scrollable screen, and understanding how modifier order affects the final interface. It also highlighted the value of consistent styling and clear visual feedback in mobile UI design.

6. AI Use and Disclosure

AI assistance was used to help draft and organize this report and to explain selected Android Studio / Gradle troubleshooting steps. The student should review all explanations, verify them against the implementation, and disclose any additional AI assistance used for code or design.

Tools used: ChatGPT | Purpose: report drafting, explanations, and troubleshooting support.
