Lab 5 | Semester App — Part 2: StudyPlanner

Project: StudyPlanner | Platform: Android (Kotlin & Jetpack Compose)

1. Implementation Summary

- P2.2 — Added Navigation Compose 2.10.2 and the Kotlin serialization plugin (Kotlin 2.2.10).
- P2.3 — Defined @Serializable PlannerHome and TaskDetail(title: String) in navigation/Routes.kt.
- P2.4 — Extended PlannerUiState with a task list and displayed three tappable study tasks on the home screen.
- P2.5 — Built a stateless TaskDetailScreen with task information, Share Task and Back callbacks, and two previews with different titles.
- P2.6 — Implemented TaskDetailRoute to launch an ACTION_SEND Intent using text/plain and an Android chooser; the shared text includes the selected task title.
- P2.7 — Created StudyPlannerApp with NavHost, navigate(TaskDetail(title)), toRoute<TaskDetail>(), and popBackStack(); MainActivity launches StudyPlannerApp.

2. Task Detail Screen

The selected task is passed from the home screen to its detail screen. In addition to the required title and buttons, the screen displays sample task description, subject, priority, estimated time, and status. These details are demonstration data, not database records.

3. Testing and Evidence

The project built successfully and the app ran in the Android emulator. The following screenshots show the home screen, selected task details, Android share sheet, and two Compose previews.

Figure 1. Home screen with three study tasks

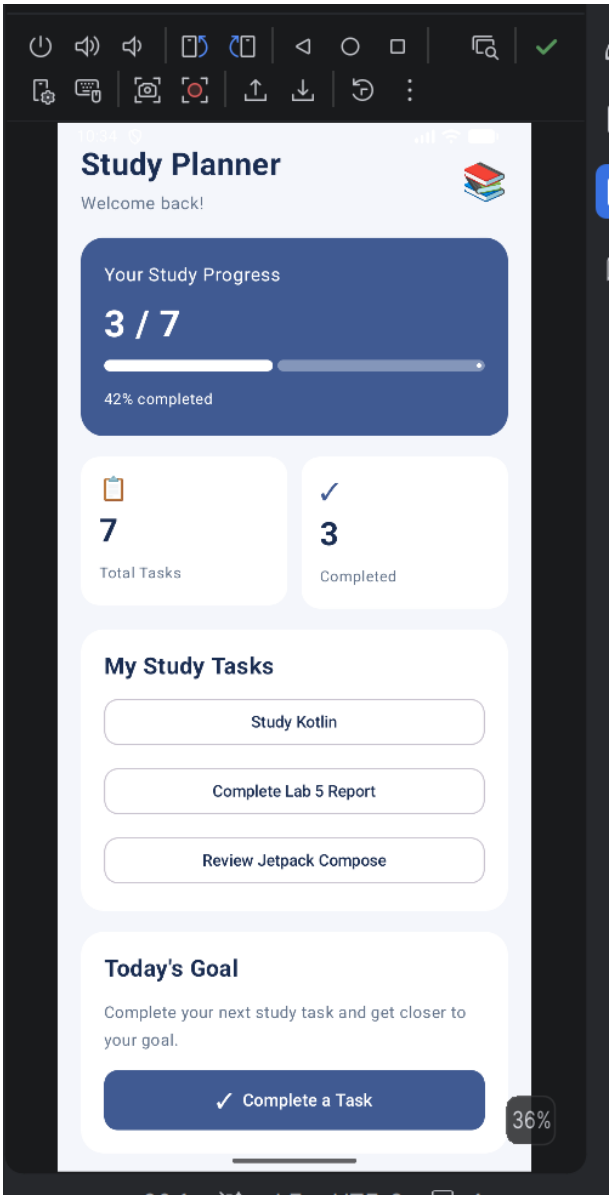

Figure 2. Task detail screen

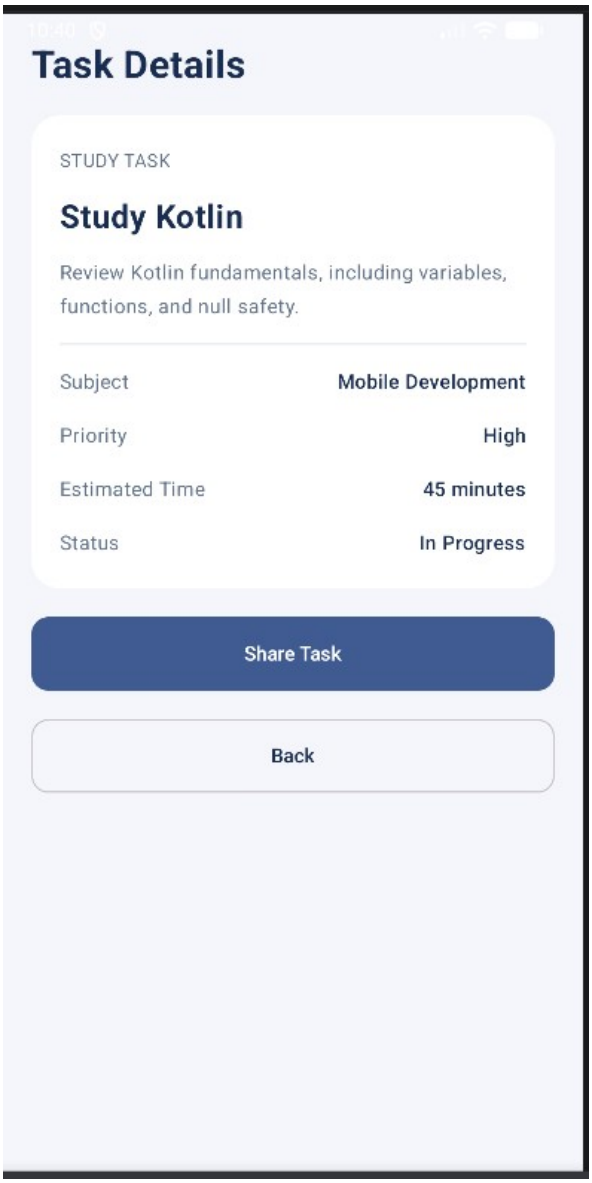

Figure 3. Android share sheet with task title

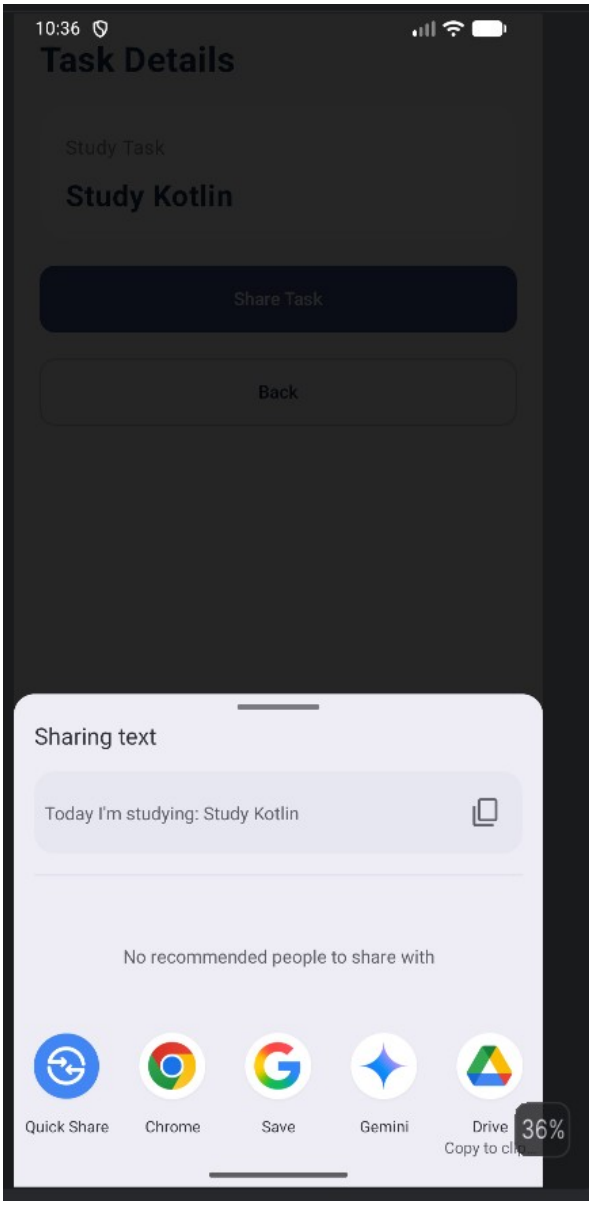

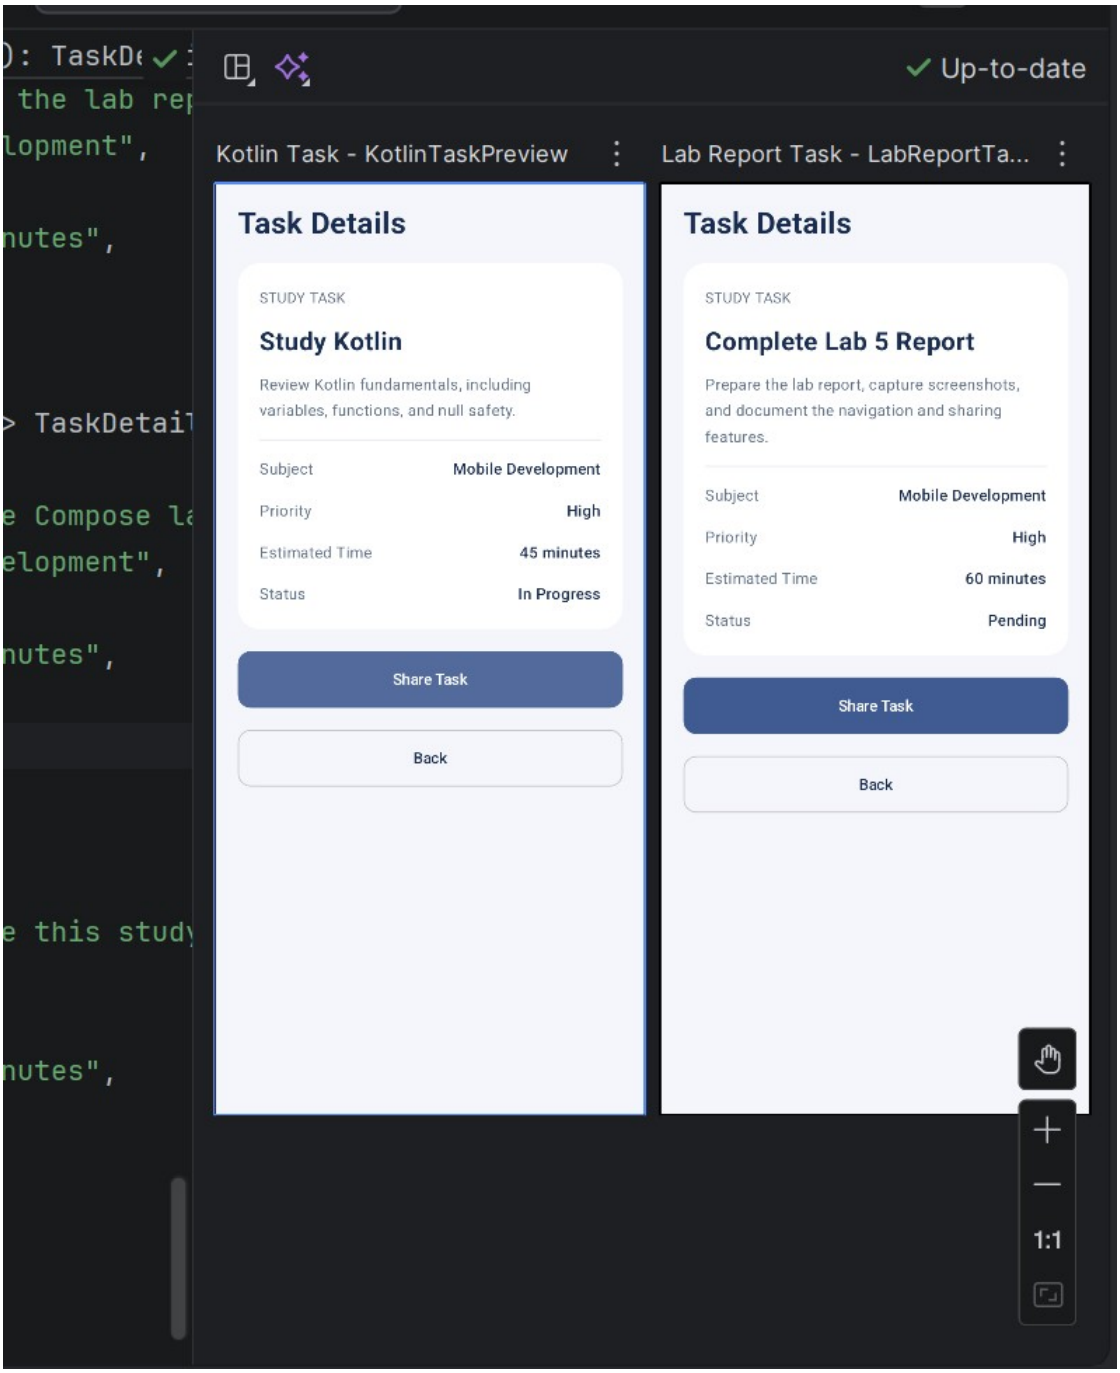

Figure 4. Two task detail previews

4. Navigation Flow and Paper Sketch (P2.1)

Navigation map: Planner Home → select a study task → Task Details → Back → Planner Home.

Information needed to open the detail screen: the selected task title. Information shown: title, description, subject, priority, estimated time, and status. User actions: share the selected task or return to the home screen.

The following hand-drawn sketches show the home screen, task details, and the controls used for navigation and sharing.

Figure 5. Paper sketch — Study Planner home screen

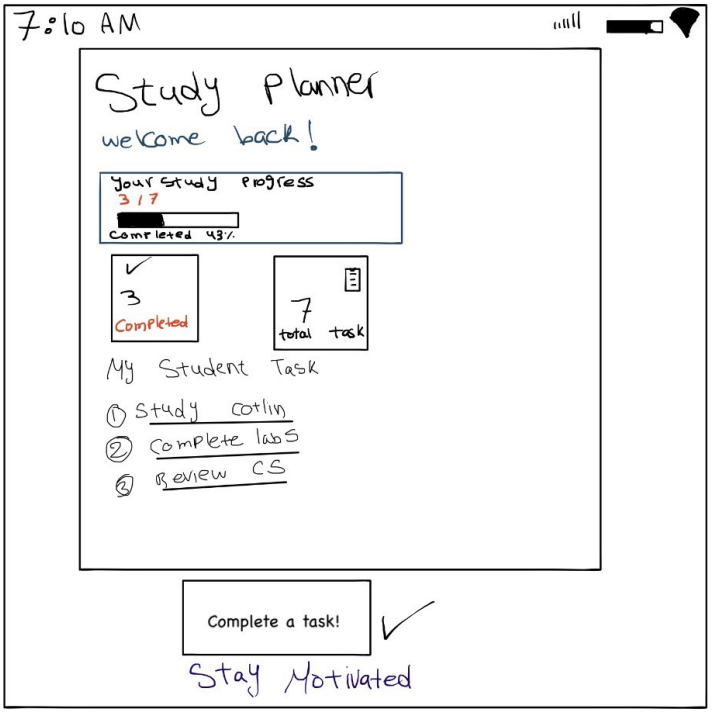

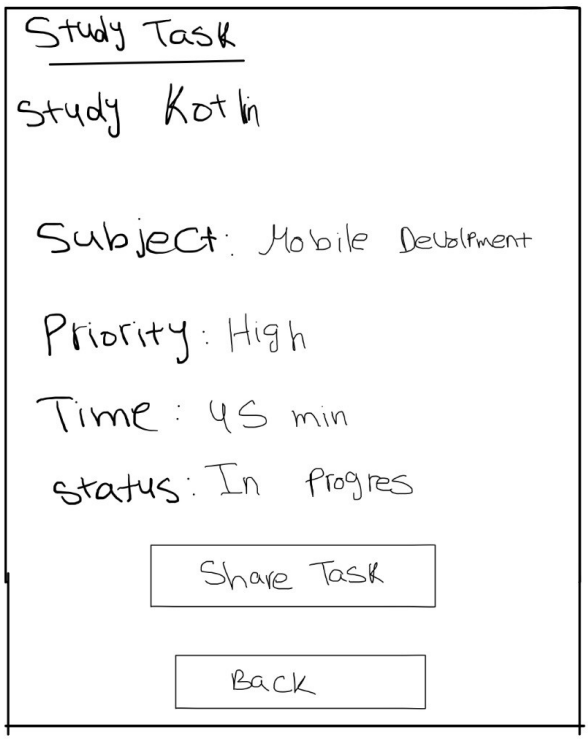

Figure 6. Paper sketch — Task details screen

Navigation: Tap “Study Kotlin” on Planner Home → Task Details. Tap “Back” → Planner Home. Tap “Share Task” → Android Share Sheet.

5. AI Use & Disclosure Log

AI assistance was used to troubleshoot recurring Android Studio build and run issues, including the “Could not connect to Kotlin compile daemon” error, and to help check implementation steps and draft Kotlin code. I reviewed and applied the suggested changes, added the in-process Kotlin compiler setting to gradle.properties, built the project again, and tested the screens and share sheet in the emulator.
